

# MODEL 1756-57

A lot of the developments within the frame industry these years are in injected materials - Materials more transparent than acetate, more flexible than acetate or as in this case TR90, which we can inject thinner than acetate.

In these models we have made two highly commercial shapes so thin that the frame both look and feels a lot lighter than acetate. The thin stainless steel temples keeps the frame light and flexible.

The colors are also a bit brighter than what you normally see in acetate. At first one color is injected, then the second, and finally the connection is polished with high precision.
